

Control panels

Circuit boards

There will be a change of the circuit boards in the Single Joystick panel, the Dual Joystick panel and both Touch panels happening within the next few weeks.

Product change details

Functionally, the revision has the following effects:

1. Auto-off timer increased to approximately 9 minutes after last use.
2. Last use will be seen by each individual panel that is activated (ON) in the circuit, so that if another panel, a radio remote, a foot switch or similar is used to run the thruster, all panels that are "on" will reset their timers. This will allow the use of these panels as "on/off" functions for other external switching devices.

Note!

The "Boat panel" (8965) and "Docking panel" 8909C have had these functions always.

For identification purposes, panels with this revision will get a G added to the part number so that the valid part numbers from now are as follows:

- 8909C** Docking panel
- 8940G** Dual joystick panels
- 8950G** Touch panel, square
- 8955G** Touch panel, round
- 8960G** Joystick panel
- 8965** Boat switch panel

All existing orders will be automatically altered to new part numbers when we are out of the previous version.

Please make sure to update your OEM customers as to this function change (We would call it upgrade because many people have asked for longer time after last use).
